

growtoo investor deck

Paper-trail raise · confidential · 2026 · live at growto.live/pitch/investor/

Journal first. Proof second. Asset layer last. Pre-seed ask: **\$150,000–\$200,000**. \$GROWTOO on Devnet has **no monetary value**. Nothing here is an offer of securities or a promise of yield.

01 · Opening

Everyone tokenises a promise. We build the paper trail first.

A free grow journal that turns plant history into evidence-backed, stage-linked proof for future real-world assets.

OPEN WITH

Journal first. Proof second. Asset layer last.

Status	Solana Devnet · early testers
Layer	Journal · proof · optional asset
Tokens	Test assets — no monetary value
Live	growto.live

02 · The gap

Beautiful token. Weak evidence underneath.

Grow data is manual, inconsistent, and difficult for an outside party to verify.

Evidence is an afterthought

Often added after the token
already exists

One-time attestation

A one-time attestation goes
stale

A number, not a history

Holders get a number, not a
living history

The opportunity is to build the evidence layer before the asset layer.

03 · Order of operations

Journal. Verify. Seal. Then adopt.

The free journal is the top of funnel. The asset layer is optional.

Journal

Logs, photos, illness checks, stages, and grower
activity.

Verify

Evidence is organised around the plant's
documented history.

Seal

A stage-linked proof asset can be minted on
Solana Devnet.

Adopt

A backer follows a specific plant and its evidence
trail.

04 · What's built

A working system, not a design doc — labelled honestly on the next section.

Layer	What
App	PWA with journal, log, camera, illness check, coach, and stories
Backend	Firebase Auth, Firestore rules, and functions
Wallets	Phantom, Solflare, and watch-only address linking
Proof	Stage-linked seed NFTs and \$GROWTOO test assets on Solana Devnet
Market	Devnet adoption and escrow flows
Docs	Public RWA architecture and risks page

05 · Honest status

Every capability is labelled by status and can be checked through the product or public documentation.

Capability	Status
Grow journal, camera, illness check, AI coach, and stories	LIVE
Stage minting, seed NFTs, plant adoption, and the market desk	DEVNET
\$GROWTOO	TEST ASSET
Harvest redemption	MOCKED
Trustless attestation, stronger verification, and a Mainnet pilot	PLANNED

\$GROWTOO has no monetary value by design.

06 · Economics

Evidence-backed harvest assets.

The weights are a designed Devnet model, not a live financial instrument. Nothing in this deck is an offer, a guarantee, or a promise of yield or returns. The legal and regulatory structure will be established before any Mainnet financial model.

Grower Documents the plant’s history and keeps the majority share under the designed model.	Adopter Supports a specific plant, with weighting based on stage of entry.	Platform Provides journaling, verification, escrow, settlement, and the market layer.
---	--	---

07 · Why now

Documentation is becoming expected. The tooling is still missing.

The immediate goal is validation: prove that growers will keep useful records and that the evidence makes a plant more trustworthy to an adopter.

Who	Need
Growers	A simple way to maintain a reliable plant history

Adopters	Evidence they can understand and follow
Solana	Infrastructure for an opt-in proof layer

08 • Roadmap

The proposed 50% lifecycle logging threshold is a hypothesis for marketplace eligibility, not a final rule.

When	What
Now	Free journal, camera, coach, and Devnet proof flows
Next	Legal entity, regulatory framework, stronger attestations, and expanded testing
Then	Mainnet pilot, 30–50 growers, and measurement of 30-day retention
Later	Evidence-backed harvest assets and redemption, subject to the legal model and operational readiness

09 • The raise

THE RAISE

\$150,000–\$200,000

Pre-seed

The capital will fund three de-risking milestones. The round is designed to turn an early ecosystem project into a validated, fundable product with measurable user evidence.

- **1 • Legal** — Establish the legal entity and regulatory framework for the RWA model.
- **2 • Mainnet** — Move the product from Solana Devnet to a properly scoped Mainnet pilot.
- **3 • Growers** — Expand from early testers to approximately 30–50 growers and demonstrate 30-day retention.

10 • Team

Bela Ikotić — product and engineering.

Building growtoo’s journal-first product, evidence model, and AI roadmap. Currently testing with early growers and collaborating with SuperteamBLKN.

Close

The asset is only as trustworthy as the history underneath it.

growtoo builds that history first.
