

Futard.io vs growtoo — \$200–250k raise

Internal board scan · 3 September 2026 · not a marketing page, not investment advice

Public futard.io scrape from 3 Sep 2026 (86 launches, \$43.7M committed). Commitments are not cash kept — miss the minimum and everything refunds. Chance bands are judgment, not a model. Do not treat this as a Futard application or a public pitch.

2. 2. What the board actually rewards

3. 3. \$150k+ asks — almost all refund

4. 4. growtoo vs the names that matter

5. 5. The model that can actually take \$200–250k
6. 6. If growers + site + social + a share hit — what is still missing

7. 7. If Mainnet ships before Futard

8. 8. Do not add investor yield to the ICO token

9. 9. How it works (platform)

1. Verdict

A **\$200–250k minimum** on Futard, with growtoo as it is today, is a **low-probability raise — roughly 8–12%**. The board does not pay for a live product. It pays for in-tribe MetaDAO narrative plus a tiny floor that can oversubscribe.

Band	Meaning
~8–12%	\$200–250k as the minimum , today
~25–40%	\$60–80k min , take up to \$200k if the book oversubscribes
8 / 86	Launches that cleared min (that day)
1	\$200k+ ask that cleared (Jurassic Finance)

Chance bands are judgment from the board, not a model. The 8–12% band is “same ask as GameByts / Mycorealms / Boltick, with less claimed revenue than GameByts and a harder legal story than Jurassic.” The 25–40% band assumes a 7-day window, MetaDAO-native campaign, and a Jurassic-style Labs token (ops only — not harvest rights).

That URL is not a growtoo launch. futard.io/launch/Ffady... is **GameByts** — a live skins marketplace that asked \$250k, got \$57,916 (23%) from 13 wallets, and is refunding. Two wallets put in \$50k and it still missed. Treat it as the closest “real product + \$250k ask” analog, not as growtoo’s page.

2. What the board actually rewards

Completes are a barbell. Four names (Futardio cult, Superclaw, Jurassic, ordr) ate most of the \$43.7M. The other ~78 launches refunded. A live product does not save a \$200k minimum — GameByts had 400 paying customers and \$13k revenue and still died. Agri + futarchy does not save it either — Mycorealms missed three times, closest at \$158k / \$200k.

Oversubscription is the product, not a 1.0x fill. Hits typically **keep the goal** (Jurassic kept \$200k of \$15.3M pledged).

Completed raises (USDC committed vs goal)

Launch	Type	Goal	Committed	vs goal
Futardio cult	Meme / platform	\$50k	\$11.4M	228x
Superclaw	AI infra	\$50k	\$6.0M	119x
Jurassic Finance	RWA collectible	\$200k	\$15.3M	76x
ordr.trade	Solana infra	\$150k	\$9.3M	62x
Kimia	DeFi yield	\$60k	\$727k	12x
GeSIM	Privacy / telecom	\$28k	\$201k	7x
Basket	Index tokens	\$10k	\$18k	1.8x
Areal Finance (1 of 4)	RWA DeFi	\$10k	\$10k	1.0x

3. \$150k+ asks — almost all refund

Jurassic is the only \$200k+ clear. Mycorealms 3rd try is the best failed agri analog (79%). GameByts is the best failed “real business” analog (23%).

Launch	Goal	Committed	Result
Jurassic Finance	\$200k	\$15.3M	Hit — kept \$200k
Mycorealms (3rd try)	\$200k	\$158k	Refund
GameByts	\$250k	\$58k	Refund
Send Arcade	\$288k	\$115k	Refund
Salmon Wallet	\$375k	\$98k	Refund
Open Music	\$250k	\$28k	Refund
Ryvo Network	\$150k	\$25k	Refund
Bynomo	\$50k	\$21k	Refund
Git3 (2nd)	\$100k	\$28k	Refund
SuperPumped	\$200k	\$0.845k	Refund
Boltick	\$200k	\$0.035k	Refund
DigiFrens	\$200k	\$7k	Refund

Why each name matters for growtoo

Launch	Goal	Committed	Result	Why it matters
Jurassic Finance	\$200k	\$15.3M (76x)	Hit — kept \$200k	Only \$200k success. Labs token first, fossil SPV later. Founder already in MetaDAO orbit. Meme + legal collectible, not a crop.
Mycorealms x3	\$70 / \$125 / \$200k	\$13k / \$82k / \$158k	Refund all three	Closest agri + futarchy story. Third try at 79% still refunds. Do not copy their rising ask.
GameByts	\$250k	\$58k (23%)	Refund	Live revenue, 400 payers, two \$20–30k whales. Still missed. A \$250k min with no public revenue is weaker.
Boltick	\$200k	\$35	Refund	Real tickets, real city. Board ignored it. “We are live” is not a Futard thesis.
HiveBits (soon)	\$140k	\$0	Not started	Bee-farm tokenization. Same RWA-agri shelf growtoo would sit on. Watch it before picking a minimum.
NFA.space	\$125k	\$1k	Refund	Physical-art RWA. Physical + chain is not enough without Jurassic distribution.
Areal Finance	\$10–50k	one \$10k hit; rest refund	Mixed	RWA DeFi can clear a tiny min. It does not clear \$50k+ on a retry.
ordr / Superclaw / cult	\$50–150k	\$6–11M	Hit	In-tribe MetaDAO infra or meme. growtoo is not this until you live in that chat for weeks.

4. growtoo vs the names that matter

Where growtoo loses

- No public user, revenue, or retention number you are allowed to print. GameByts could. They still missed \$250k.
- Cannabis harvest rights are a worse legal object than a fossil in a Cayman SPV or a mushroom farm. Futard tokens are explicitly not equity, not a security, not a claim on an entity. Selling “adopt a plant / harvest” as the ICO is the wrong instrument.
- Product is Devnet. \$GROWTOO has no monetary value. On-chain proof is a journal trail, not a physical plant. Honest — and the Futard buyer is buying a token that can dump on day one (ICO float unlocks immediately).

Where growtoo is not vapor

- Live journal at growto.live: auth, coach, camera, Stories, 14-day list gate, Devnet escrow program. Most refunded launches were a PDF and a vibe.
- The Labs paper already uses the Jurassic shape: Raise I = operating company, Raise II = harvest SPV later. That is the only \$200k pattern that actually cleared on this board.
- Monthly \$8k runway math is in the same band as Futard spending caps (\$10–14k on GameByts / Manna). The mechanism will enforce the cap onchain if you finish.

5. The model that can actually take \$200–250k

Do not set the **minimum** at \$200–250k. Futard is all-or-nothing on the floor. Set the floor where the board sometimes clears, and take \$200–250k only if the book oversubscribes (same as Jurassic: \$200k kept from a \$15M book).

Piece	Spec
Floor	\$60–80k minimum. Completes cluster at \$10–60k plus two in-tribe exceptions (ordr \$150k, Jurassic \$200k). \$80k is aggressive but not GameByts-suicidal.
Take	\$200k accept / \$250k hard max. If the book fills, accept \$200k (Jurassic FDV template: 25.8M supply, 10M ICO, ~\$516k FDV at \$0.02). Stretch to \$250k only if you already have named wallets in the book.
Window	7 days, not 1 hour. Jurassic ran 8–15 May 2026. You need time for MetaDAO / Ownership FM / Futard cult to notice. A 1-hour window is for people who already have the chat.

Copy Jurassic — do not copy GameByts / Mycorealms

Piece	Copy Jurassic	Do not copy GameByts / Mycorealms
What the token is	Labs / ops / governance. Journal, coach, mainnet path, legal. Later SPVs are separate tokens.	Do not sell harvest, adopt-stake yield, or \$GROWTOO as the ICO. Futard terms forbid that reading anyway.
Legal wrapper	Cayman SPC via MetaLeX (standard Futard B1). IP licensed to the DAO. Team keeps brand on wind-down — disclose it.	Do not imply token = plant ownership. Cannabis needs counsel before any harvest SPV. That is Raise II.
Spend cap	\$8k/mo onchain (12 months from \$96k). Extra only via futarchy.	GameByts asked \$14k/mo on a \$250k floor. The floor killed them, not the cap.
Use of \$200k if filled	50% runway, 15% counsel (cannabis + token), 35% Mainnet + 30–50 growers + Raise II term sheet.	Do not put 20% in an LP story as the pitch. LP is already in the Futard machine.
Team lock	18-month cliff + 2x/4x/8x/16x/32x TWAP tranches (platform default).	Unlocked ICO float will trade the day you clear. Price is not a harvest.
Distribution	Two weeks inside MetaDAO / Futard cult before the clock. Named first \$20–40k in the book.	Do not open cold. GameByts' 13 wallets were not a crowd. Two whales ≠ a fill.

6. If growers + site + social + a share hit — what is still missing

Those four move you from “cold PDF” toward “real.” They do not fill a \$200k floor. GameByts already had product, revenue, and creator distribution. The board still refunded them. Add the items below or the week looks like Mycorealms try four.

Must do	What “done” looks like	Why the board cares
Set the floor at \$60–80k	Minimum is not \$200k. Accept \$200–250k only if the book oversubscribes.	Miss the min by \$1 and every dollar refunds. GameByts died on the floor.
Anchor the book before T0	2–4 wallets ready to put \$20–40k in the first hours. Names you actually have, not hope.	A dead first screen never recovers in 7 days. Two whales alone still failed \$250k.
Live in MetaDAO / Futard cult for 2+ weeks	Bela as a person in those chats, not only @growtoo420. One AMA in-window.	Jurassic cleared because the founder was already in-tribe. Generic cannabis Twitter is the wrong room.
Counsel + Cayman SPC + B1 before the form	Token = Labs ops / governance. Harvest SPV is Raise II, said on every page. 18+ / local law.	Futard tokens are not equity. Cannabis as the ICO object is how you get ignored or worse.
Growers that a stranger can click	30–50 real journals on journal.growto.live. A few 14-day trails. One public list→adopt on Devnet. No traffic-sim as the demo.	“We put growers in” is a claim. A public slug with boring daily logs is evidence.
Futard page, not a prettier landing	One English page: what the token is, \$8k cap, use of funds, Devnet honesty, no harvest yield.	Buyers land from futard.io. They will not read the sage marketing site.
One share object that travels	A single plant: 21 care days, listed, adopted. Screenshot + public URL. No user-count brag.	The board shares mechanisms, not “download our app.”
Don’t collide	7-day window. Watch HiveBits. Don’t open the same week as another RWA-agri meme.	Attention on this board is one thread at a time.

7. If Mainnet ships before Futard

The Labs paper funds Mainnet **from the raise**. Doing it first means you pay for deploy, audit, SOL, and counsel out of pocket. It helps the story. It does **not** flip the \$200k floor. Boltick and GameByts were already live and still refunded.

A scoped pilot is the only version that is honest: a few listings, USDC settlement, no harvest, no faucet, no \$GROWTOO coupon.

What	Devnet today	Mainnet before Futard
Journal / coach / Stories	Unchanged. Firebase. No wallet needed.	Unchanged. Mainnet does not make the journal truer.
14-day / 50% list gate	Process evidence. Fake logs still possible.	Same gate, now with real money. Fabricated trails become a real-loss bug. Attestation must harden or you do not list.
\$GROWTOO	No monetary value. Faucet OK.	If it has a price, the faucet dies and it is a real token. Do not make it the investor yield. Prefer USDC on the board so \$GROWTOO stays a points/fee chip or stays off.
Plant NFT + adopt-stake	Test. Half-lock is a mechanic, not a return.	Real USDC in escrow. Still “follow one plant,” still not a Labs dividend. Harvest claim stays off until Raise II.
Labs / Futard token	Does not exist.	Still no coupon. Story gets better (“desk already settles”) but the token is still treasury + cap + later origination.
Harvest SPV	Mocked.	Still mocked. Mainnet does not legalize a crop. Do not turn redemption on.
Legal / ops	Test assets, operator mint queue.	Need audit, real key ceremony, kill-switch, ToS for real money, counsel memo before first listing. Cannabis + real USDC is the line the Labs paper said to cross after the raise.
\$200k Futard odds	~8–12% as a minimum.	Maybe mid-teens if there is public Mainnet volume and clickable growers. Floor should still be \$60–80k. Mainnet is not Jurassic.

8. Do not add investor yield to the ICO token

A coupon, APY, buyback, or “harvest share for token holders” is the wrong instrument. Futard’s own B1 text says the standard launch creates **no dividend or revenue entitlement**. The Labs paper already says this round is not a sale of harvest title and you will not copy yield onto a test token. Cannabis + a yield promise is also the Howey-shaped reading you cannot afford. The board already has Kimia for yield. You will not out-yield them. Mycorealms (“all revenue to the DAO”) still refunded.

Layer	What it is	Who gets cash / rights	When live
A • \$GROWTOO	Devnet test currency. Stage rewards, faucet, board asks.	Nobody. No monetary value. Do not migrate this into an investor coupon.	Now (test only)
B • Plant NFT + adopt-stake	One plant, 14-day trail. Sale or 50/50 care lock.	Grower gets the sale / unlocked half. Adopter follows one plant. Not a Labs dividend.	Devnet now. Mainnet only after counsel.
C • Labs token (only if you do Futard)	Treasury + \$8k/mo cap + futarchy. Same job as \$RAWR: operate the desk.	No coupon. Designed later: origination fee on each Raise II SPV (Jurassic used 10% USDC + 5% of that SPV's supply — numbers for counsel, not a live promise).	If the Futard min clears. Fee is off until Raise II exists.
D • Harvest SPV token	One batch, one vehicle, own token, operating agreement.	SPV holders — that is the only place “investors” buy crop economics. Labs takes a disclosed origination cut, not the harvest.	Raise II, after entity + memo. Not this raise.

Designed Mainnet market split (not live, not a Futard slide): grower keeps the majority of a listing; Labs takes a thin escrow / listing fee; adopt-stake stays a care lock, not an APY. Exact percents wait for counsel. Do not print them as a return.

If you insist on a \$200k minimum

You need a Jurassic-class week: in-tribe founder, a one-line meme (“journal first, token second”), a Cayman Labs story, and a book that is already loud before the form goes live. Without that, the honest base case is GameByts — \$50–80k pledged, refund, you look weak for the next try (Mycorealm had to come back three times and still missed).

9. How it works (platform)

- Hit the **minimum** or **full refund**.
